Shop Focus: Preparing your equipment for winter

With the winter winds soon blowing, it is never too soon to prepare your equipment for the season to come.

Winter-specific preparation
Winter involves using different equipment such as chains, heaters, and additional plowing attachments. Preparation means having this winter-specific equipment inspected, stocked, and ready to go once the previous season ends.

To prepare for winter, the city of West Des Moines follows an exhaustive two-page checklist for equipment maintenance and performs vehicle inspections from top to bottom. “It’s not an option to have anything not be available,” says West Des Moines operations supervisor Bob Dingman. His preparations include mounting spreaders, greasing deicers, adjusting chains, and checking plow blades to ensure all equipment performs as it should. “We pride ourselves on our snow program to keep the major streets open at all times,” he says.

By September, Dingman’s agency is already updating its snow and ice control manuals with new streets, expanded zones, and more. His agency also holds annual snow meetings to inform personnel of any changes. At the same time, he is also advertising for part-time, on-call help to fill in for any absences that may occur in the winter. Updated manuals, meetings, and part-time help all go together, he says, stressing the importance of winter preparation. “We have to make sure everyone is up to speed on what’s new.”

Early fall is also when West Des Moines motor grader operator Matt Dolan runs through winter-specific preparations. His equipment inspections include air pressure adjustments to tires to support his vehicle’s wings, chain inspections, and antifreeze checks. Once he has inspected his equip-

- Batteries
- Connections

Agencies handle equipment inspections and repairs differently. In West Des Moines, machine operators such as Dolan inspect and repair their machines throughout the year. When winter approaches, the preparation is already underway.

Failure to keep a watchful eye on regularly used equipment can lead to trouble. Drivers can become stranded in frigid conditions because of equipment failure or simply running out of fuel. “There’s nothing like being stuck in a blizzard with a broken vehicle,” says Dolan. Continual equipment inspection is part of Dolan’s year-round motor grader operation. Not only will this yearly preparation ensure you’re ready for the winter, but, Dolan says, “it will add time to your equipment’s life, as well as to your own.”

For more information

For more information on preparing your agency’s winter equipment, contact West Des Moines operations supervisor Bob Dingman, 515-222-3535, bob.dingman@wdm-ia.com or West Des Moines motor grader operator Matt Dolan, 515-222-3480.

---

Snow and ice control

✔ Equipment checklist

Spreader

- Inspect pumps, hoses, controls, and fittings.
- Check spinners, augers, and auxiliary engines.

Hydraulic spreader controls

- The two major components are the pump and the controls, whether manual or automatic. Operators should become familiar with spreader controls. Understand how the auger, or conveyor, and the spinner react at various settings.

Snow plow blades

- Carefully inspect blades after each use. If blade wear is excessive it may damage the moldboard. Snow plow blades do not wear evenly and should be replaced when they are worn at any point.

Electrical equipment

- Inspect and service all lighting and electrical equipment regularly, including wiring and sockets.
- Carry ample stocks of parts for rotating flasher units, including lenses and lamps.

Safety equipment

- Make sure there are flashlights, flares, flags, safety vests, and first-aid kits in truck cabs.
- Don’t start a run without securing your seat belt.

Plan for emergencies

- Know the locations and telephone numbers of emergency repair and refueling stations.
- Skilled personnel should be on hand in garages during storms to promptly carry out minor repairs.
- Replenish spare parts inventory immediately following storms, or at the first opportunity.

---

Training your employees

Proper snow plow skills are essential to successful snow management. Every year Iowa’s Snow Roadeo offers participants an opportunity to test their skills operating a snow plow. Below are some training tips used in the snow roadeo your agency can try.

- Practice driving forward/backward.
- Navigate obstacles (e.g., barrels, cones).
- Check warning lights.
- Practice spotting and operating wings.
- Negotiate curves.

For more information and to download the snow roadeo training course map and materials, visit: http://www.ctre.iastate.edu/events/expo/snowplow.htm.
2008 Snow Roadeo winners

More than thirty teams and twenty individuals competed in the 2008 Snow Roadeo, held September 10 at the Iowa Speedway Complex in Newton. The Roadeo offered snow plow truck drivers, motor grader operators, and loader operators the chance to test their knowledge and demonstrate their skills. Congratulations to all the winners!

**Snow plow truck winners**

1st place—Craig Shepherd and Randy Moore, City of Des Moines

2nd place—Wayne Barrett and Scott Thomas, City of West Des Moines

3rd place—Brian Crnkovich and Jeff Sherman, City of West Des Moines

**Motor grader winners**

1st place—Matt Dolan, City of West Des Moines

2nd place—Gary Rank, City of West Des Moines

3rd place—Johnny Virden, City of Des Moines

**Loader winners**

1st place—Jim Case, City of Des Moines

2nd place—Randy Salm, City of Iowa City

3rd place—Pat Linehan, City of Davenport

2008 Snow Roadeo sponsors and donors

Thank you to all those who made the 2008 Snow Roadeo possible through various forms of sponsorship and donations.

Fenced in: Keeping snow off the road

Snow fences are an effective and economical way of improving winter safety. They keep snow and ice off the road and increase driver visibility by reducing the force of the wind on the snow. A 2006 report by Tabler & Associates revealed that snow fences helped reduce accidents caused by poor visibility by up to 70% along I-80 in southeastern Wyoming.

Snow fences may also reduce costs by supplanting traditional snow removal, reducing the number of trucks and salt used to keep roads clear. Simply put, snow fences are a great addition to an agency’s winter program.

It begins with preparation
Effective snow fence installation requires a plan of action. “Putting up a snow fence is the easy part,” says Iowa DOT Road Weather Information Systems Coordinator Tina Greenfield, stressing that preparation is the key to success. Successful snow fence installation demands you know the right spot to install a fence. A poorly placed fence can be ineffective or do more harm than good. Preparation is also important if the snow fence needs to be installed on private property, such as local farm land. Your agency will need enough time to establish a relationship with the farmer to allow your use of the land.

Three steps to snow fence success
According to Greenfield, there are three primary steps in preparing snow fences for installation, each of which will increase your likelihood for success.

1. Identify your spots. Knowing the roads and areas with the biggest drift and visibility problems will help you figure out where a snow fence is needed. To do this you can ask experienced employees who are familiar with trouble spots.
2. Identify your best chance for success. Not every trouble spot will yield the same chance for success. Some spots may be unavailable due to constraints such as land access or configuration.
3. Identify your budget. Installation requires time, labor, and materials. Determining all three of these will give you a better idea of how to successfully implement your snow fence program and operate within your means.

When to install
If your agency needs to contact landowners and establish a contract with them to install a snow fence on their land, then by late summer you will want to establish talks and develop a plan for winter.

Many times installation cannot begin until harvest ends and a farmer is out of the field. This can be potentially troublesome depending on the weather. Once the ground freezes and receives snow, it may be too late to install.

Where to install
As a rule of thumb, a snow fence should be installed at a distance of 35 times its height from the edge of the road. That is, if you were installing a six-foot-high fence, it would need to be at least 210 feet from the road to be effective. This distance will set the fence far enough away to allow snow to accumulate before the fence and between the fence and the road, rather than over and on the road itself.

A common pitfall in snow fence installation is placing a fence too close to or too far from the road. A fence too close to the road can actually increase the amount of snow on the road. A fence too far from the road will allow the wind to pick snow back up and deposit it on the road. It is best to properly measure the distance and, if needed, to install multiple fences.

A snow fence should also extend approximately 20 feet or 30 degrees past the length of the area intended for protection. This will reduce the effect of wind wrapping around the edge of the fence, increasing the area of coverage. Extending the fence also helps protect against a larger variation of wind directions.

The orientation of the snow fence should be parallel to the road and perpendicular to prevailing winds. However, the makeup of the terrain may alter fence placement. An adjust-
ment in a fence’s angle up to 25 degrees will not significantly detract from the fence’s effectiveness.

How to install
The physical installation of the fence is perhaps the most traditional part of the installation process but can vary depending on the type of your fence. Common fence types include post-supported fences, truss-type fences, and living fences.

Post-supported fences are made by driving steel or wooden posts into the ground, unpacking the fencing material, and tying the fence to the posts. This type of fence can take more time and labor to install, with numerous trips to transport materials.

Truss-type fences consist of a surface-mounted framework that’s anchored to prevent overturning in the wind. Truss-type fences are often prefabricated, reducing the time and labor required to install them.

Living fence installation is up to the land owners, who plant trees or shrubbery or leave corn stalks in their fields to act as a fence and prevent the wind from carrying snow onto the road.

A gap of approximately 10% of the fence’s height should be left underneath the snow fence. If you were installing a fence with a height of four feet, you would want to install the fence with 4–5 inches between the bottom of the fence and the ground. This gap will prevent snow from accumulating near and on the fence. This will reduce extra weight and damage from snow accumulation and increase the effectiveness of your fence.

A successful installation
The benefits of snow fences cannot be overlooked. Ineffective snow fences, or a lack of snow fences can result in impaired driver visibility, buried informational signs, and snow drifts making a road inoperable—all of which increase the dangers and risks to road workers and drivers. Snow fences help reduce these dangers and reduce the costs of other means of snow removal to provide better snow management.

For more information
For more information, contact Iowa DOT RWIS Coordinator Tina Greenfield, 515-233-7746, tina.greenfield@dot.iowa.gov.
Editor's note: The two articles on page 6–8 are the latest in a series based on information in Iowa’s Local Roads Maintenance Workers’ Manual. The manual was developed by CTRE and sponsored by the Iowa Highway Research Board (TR-514). The series began with the July–August 2006 issue of Technology News. Previous topics included maintaining gravel roads and identifying/repairing pavement distresses.

Routine bridge observation activities

A bridge failure can be catastrophic. It can cause injury or death and can be very expensive to restore. Defects, damage, erosion, or other serious flaws need to be addressed quickly.

City and county road maintenance workers should always be alert for and tell your supervisor about any signs of bridge problems. As you drive over bridges or work in their vicinity, be aware of the signs of bridge stresses.

Conduct these informal observations on a routine, ongoing basis during all seasons of the year. When spring arrives, look particularly at bridge approaches and bridge decks for deterioration from freeze-thaw action.

Bridge approach

On gravel road approaches to bridges, look for the following potential problems:

• Poor crown transition from the road to the bridge deck.
• Too much aggregate and/or inadequate crust on the bridge approach, so that the aggregate migrates onto the bridge deck. Aggregate on the bridge deck may, in effect, narrow the operating width of the bridge.
• Standing water or erosion at the shoulder line.

On paved road approaches to bridges, look for the following potential problems:

• Pavement distresses and excessive cracking
• Joint failures
• Erosion at the pavement edges
• Cracking or settlement of approach slabs
• Poor condition of expansion joint where the slab meets the bridge deck
• Poor ride
• W-beam rail sections badly bent out of shape

• Loose bolts
• Loose, broken, or rotted wooden posts
• Bent or badly off line steel posts
• Inadequate guardrail blister offering too little support of the end section
• Holes or ruts under the guardrail that vehicle wheels could drop into
• Traffic damage
• Too low or too high rail
• Overgrown vegetation under and around the rail

Bridge decks

In Iowa, bridge decks can be timber, concrete, or steel.

Timber decks. Potential problems:

• Loose nails, spikes, or fasteners
• Openings between planks over abutments and piers which allow dirt to sift through
• Split, worn, broken, or decayed planks

Concrete decks. Potential problems:

• Cracking
• Leaching
• Exposed reinforcing
• Scaling
• Potholes
• Spalling
• Other evidence of deterioration

Steel decks. Potential problems:

• Corrosion
• Unsound welds
• Loose welds where the deck is fastened to the stringers
• Dirt collected in open-grid decking on top of stringers
• Deteriorated paint
Traffic control devices
Typical traffic control devices (TCDs) at bridges include object markers, delineators, pavement markings, and signing. All TCDs should be easily visible and not damaged or worn.

Structural members
Observe the condition of trusses by sighting along the roadway rail or curb and along the truss chord members. Look for truss misalignment, either vertical or horizontal. Bent trusses may reduce the bridge’s operating width and/or reduce the structure’s soundness.

Note any members damaged by vehicles.

Underside of the deck. Potential problems:
- Seepage
- Calcium deposits
- Cracks in the deck
- Exposed reinforcing

Structural members. Potential problems with steel or pre-stressed concrete beams, bridge abutments, and backwalls:
- Steel beams that are corroded, discolored, or bent from being hit
- Pre-stressed beams that are cracked or have pieces missing, particularly on the bottom flanges
- Backwalls that are eroded or pushed out of alignment
- Abutments that are deteriorated or have erosion problems or leaking deck joint
- Bearings that are corroded or frozen up due to rusting

Piers and columns. Potential problems:
- Erosion at the bottom of the columns
- Deteriorated concrete in the columns
- Pier caps that are cracked or out of alignment
- Piers that are damaged due to ice or other debris

Slope protection
The purpose of bridge slope protection is to control erosion and vegetation growth. On paved slope protection, look for the following potential problems:
- Broken panels (Broken panels may not need to be replaced if they are seated and generally conform to the slope.)
- Cracks (Although cracks themselves are not detrimental to the performance of slope protection, they should be sealed to prevent water intrusion, which may cause settlement and/or sliding of the panels.)

Most slope protection is riprap or revetment. Look for the following problems:
- Bare areas
- Exposed fabric
- Erosion
- Inadequate rock size

Drainage systems and waterways
Drainage systems should be repaired or replaced as necessary to prevent further damage. Look for the following potential problems along the waterways:
- Debris collecting near piers or in the stream channel. Debris accumulations may cause scour, redirect the stream channel, apply excessive hydraulic loads, or become a fire hazard. They should be removed as soon as possible.
- Damage to wing dams, etc., which protect the bridge or control the streambed. Such damage should be scheduled for repair as soon as possible.
- Sand and gravel bars that divert water flow and perhaps cause scour

For more information
For in-depth bridge inspection and repair documents and courses, contact Iowa LTAP librarian Jim Hogan, 515-294-2481, hoganj@iastate.edu.

Characteristics of well-maintained bridges
- The operating lanes are as wide as they were when the bridge was constructed.
- Structural members are free from damage and corrosion and are in the same alignment as when they were built.
- The deck is free of debris and deterioration.
- All traffic control devices are in place, well maintained, and visible.
- The channel is free of erosion.
- The channel and structural members are clear of debris.
- The bridge railing is in good condition.
- Any approach guardrail is in place and properly aligned.
- The approach provides smooth access to the bridge deck.
Just for street and road workers

Routine bridge work

Consult your supervisor and perform routine bridge maintenance and repair as directed.

Cleaning
First remove debris or excess vegetation from the bridge approach, bridge deck, under and around the guardrails, under the bridge, and in the waterway.

Dispose of accumulated debris. Do not leave debris where it might be picked up during the next high water event.

Clean decks, piers, abutments, and expansion joints. You may be asked to blow incompressible materials from the joints.

Blading the bridge approach (granular surface)
Bridge approaches may need frequent blading because they are difficult to drain and the subbase beneath the crust is prone to settling.

If a bridge deck is crowned, gradually reduce the road crown to match the bridge crown. If the bridge does not have a crown, gradually zero out the road crown to meet the elevation of the bridge deck.

Do not drag too much rock onto the bridge deck.

Repairing wood decks
Loose or broken planks can create a safety hazard for drivers. If you observe either, tell your supervisor immediately.

You may be asked to make minor repairs. First, tighten loose planks with existing or new bolts.

Then determine the number of planks to be replaced, and measure the lengths required. Bring new bridge planks to the site and cut them to length using a chain saw. Remove and replace old broken planks.

When you’re finished and the bridge deck is secure, notify your supervisor. Documenting the timing of maintenance repairs can be critical in liability lawsuits.

Repairing delaminated decks
To determine the extent of surface delamination, drag a log chain over the entire deck surface. Where the concrete is deteriorating, you will hear a distinct hollow sound. Mark these areas with spray paint.

With jack hammers and hand tools remove the deteriorating concrete down to sound concrete. The deterioration may extend under the re-bars. Thoroughly clean the area with an air compressor and power and hand brooms.

If you are repairing the deck during cold weather, place a temporary asphalt patch.

If the weather is moderate, apply a grout or bonding agent and then place a concrete surface patch. Cover the new concrete with a liquid curing compound, plastic, and/or wet burlap, as directed by your supervisor. This protection allows the concrete to cure (develop the required strength) adequately before traffic is allowed on the concrete.

Effects of delamination on bridge decks
Delamination is generally caused when chloride ions (salts) infiltrate the concrete deck and eventually corrode the reinforcing bar (re-bar). When steel corrodes, it expands up to eight times. The expansion puts pressure on the concrete until its bond with the re-bar is broken and cracks develop.

Eventually pieces of the concrete deck will come loose and break off. Broken areas are like tooth decay: They will spread until the damaged areas are removed and filled with new material.
The Iowa LTAP Advisory Board

Editor's note: This article is part of our ongoing series celebrating Iowa LTAP’s 25th anniversary in 2008.

In 1983, the Iowa LTAP began providing services to Iowa’s cities and counties. As time went on, the LTAP staff wanted to know how they were doing. Were the newsletter articles helpful to city and county employees? What additional training programs were needed? How could the library better serve local agencies?

To answer these questions and create better communication between the Iowa LTAP staff and the local agencies it serves, Iowa LTAP created its first advisory board in 1994. The 1994 advisory board consisted of representatives from the Iowa County Engineers Association (ICEA), the Iowa chapter of the APWA, the Iowa Highway Research Board, the Iowa DOT, and the FHWA.

“We wanted to bring all the LTAP partners to the table to help provide guidance and oversight for the program,” says Iowa LTAP Director Duane Smith.

Early goals

The primary goals of the first advisory board were to identify the needs of cities and counties and to figure out ways for LTAP to meet those needs. A notice was published in Technology News, introducing readers to the advisory board members and encouraging them to contact board members to comment, make suggestions, or ask questions about the Iowa LTAP.

The board members brought valuable feedback to Iowa LTAP from the agencies they represented. Agencies reported that Technology News was the main way they received information about LTAP programs. They requested articles on communication, technology, and practical “tips from the field.”

“The most valuable thing about the first advisory board was the way they helped us look at how we interacted with our partners,” says Smith. That interaction, he adds, is what makes Iowa LTAP so successful.

Moving forward

Beginning in 1999, the role of the board changed. The agency representatives continued to review the LTAP program and provide feedback for its improvement. The local government representatives began to move away from their strictly reviewing function and began to operate as a working board.

The members of the working board wanted to find a way to increase participation in LTAP training programs. At a 1999 board meeting, they discussed the possibility of developing an accomplishment program to recognize workers for participating in LTAP training programs. This idea became a reality in 2001, when the Roads Scholar Program was implemented through the National LTAP program.

The LTAP board also played a major role in the development of the Iowa Secondary Roads Maintenance Supervisors Association (ISRMSA). Secondary roads supervisors worked in rural counties all across the state and didn’t have much contact with each other.

“Supervisors needed a forum to discuss more management-type issues,” says Bob Sperry, LTAP Local Roads Safety Liaison and LTAP advisory board member from 1994–2008.

“[The ISRMSA] allowed them the opportunity to share common problems and work together to find solutions,” Sperry adds.

Looking to the future

The current Iowa LTAP advisory board continues to work on developing new programs and finding more effective ways to serve Iowa’s cities and counties. The board members are the lifeline connecting Iowa LTAP with the agencies and organizations it serves.

“The board members know our program and are very good at bringing us input from their organizations,” says Smith. “Many times they help with ongoing programs or participate in the development of new ones.”

For example, the Iowa chapter of the APWA is working jointly with Iowa LTAP to develop the Iowa Public Employees Leadership Academy. The ICEA provides ongoing support for the Motor Grader Operator Program. The Iowa DOT works with LTAP on the biannual Iowa Maintenance Expo. Finally, FHWA and IHRB provide substantial funding to the LTAP program each year.

Meet your LTAP board

Board members for 2008–2009 are always listed in the sidebar on page 4 of Technology News. Feel free to contact them to ask questions or give us feedback.

Board members serve two-year terms. When a board member rotates off the board, the agency or organization that he or she represents is asked to provide a replacement. If you’re interested in serving on the LTAP advisory board, contact Duane Smith at 294-8817, desmith@iastate.edu.

The advisory board provides guidance and oversight for the LTAP program.
Stanley L. Ring Memorial Library: New acquisitions

**Note about delivery of materials:** The library now sends orders through the U.S. Postal Service. This change is resulting in important savings for LTAP, but ordered materials do not arrive as quickly. If you have an urgent need for library materials, let us know when you place your order and we will arrange faster delivery.

### Three ways to order LTAP library materials
- Use the online catalog, www.cte.iastate.edu/library/search.cfm.
- Contact Jim Hogan, library coordinator, 515-294-9481, hoganj@iastate.edu, fax 515-294-0467.
- Mail or fax the order form on the back cover of Technology News.

### Publications

**P-1723  Informational Report on Lighting Design for Midblock Crosswalks**
This report provides information on lighting parameters and design criteria that should be considered when installing fixed roadway lighting for midblock crosswalks.

**P-1724  Minimum Retroreflectivity Levels for Blue and Brown Traffic Signs**
This report describes the research activities and consequent findings related to the development of recommendations for minimum retroreflectivity levels for white-on-blue and white-on-brown traffic signs.

**P-1725  Rumors, Myths, and the Straight Facts**
This brief reference dispels misinformation regarding sign sheeting products and regulations.

**P-1726  Barrier Guide for Low Volume and Low Speed Roads**
This guide provides assistance in the warranting, selection, and design of roadside barriers on low volume and/or low speed Federal Lands Highway projects.

**P-1727  Facilitating Your Own Meetings: Essential Skills for Managers and Supervisors**
This publication presents basic skills for effective meeting facilitation. It provides pointers for doing it yourself, knowing when to call on another group member to facilitate, and when to bring in someone from the outside.

**P-1728  Roadside Revegatation: An Integrated Approach to Establishing Native Plants**
This report offers an integrated approach to facilitate the successful establishment of native plants along areas of disturbance associated with road modifications. It guides readers through a comprehensive process of initiating, planning, implementing, and monitoring a roadside revegatation project with native plants.

### Videos and DVDs

**DVD-173  Safe Operation of John Deere Skid Steers and Compact Track Loaders**
This video shows the pre-starting and daily maintenance procedures for the 300 Series skid steers and compact track loaders. It explains the controls and safety systems on these units, provides some tips, and demonstrates techniques for safe operation to help make work easier and more efficient.

**V-758  Herbicide Selection and Safe Use**
This video covers safe and effective weed control, with emphasis on in-field safety. It includes information on proper equipment and clothing, as well as the choosing, storage, disposal, and spills of herbicides. Also available on DVD-175.

**V-759  How to Respond to an Emergency**
This video covers the basic steps of emergency response and shutdown and evacuation procedures. Also available on DVD-176.

**V-760  OSHA Recordkeeping**
This video shows how to avoid over-recording accidents while still complying with OSHA regulations. It gives clear guidance for accident/illness paperwork. Also available on DVD-177.

### Low-cost safety and traffic studies workshops

Registration is now open for a series of low-cost safety and traffic studies workshops for cities, counties, and planning agencies, sponsored by the Iowa DOT.

Three rural sessions and two urban sessions will be offered at three different locations across the state. There is no charge for attendance. Register online at www.ctre.iastate.edu/events/low-cost-safety-traffic.htm.

Representatives from the Iowa DOT, the Iowa Governor's Traffic Safety Bureau, FHWA, and CTRE will speak on a range of traffic safety issues, best practices, and low-cost maintenance improvements.

For more information, contact Tom McDonald, Center for Transportation Research and Education, 515-294-6384, tmcdonald@iastate.edu.

### Tractor-Mower workshops a success

Iowa LTAP held its first round of Tractor-Mower Operator Safety Training (TMOST) workshops in August. Sixty-six people attended the workshops, which were held in four locations across the state. The workshops were highly rated by attendees in all locations.

TMOST, which is the most recent addition to LTAP’s training lineup, included four hours of classroom training and three hours of hands-on training. Topics included safety before, during, and after operation; equipment inspection; and use of personal protective gear.

The workshops were originally scheduled in June, but were postponed due to the flooding that occurred across the state.

If you were one of the many people who planned to attend the June workshop but couldn’t attend in August, keep your eye on Technology News for additional TMOST offerings in spring 2009 or check out the LTAP event calendar at http://www.ctre.iastate.edu/calendar/index.cfm.
